

Pranan FAQ's

RETURN POLICY:

We offer a 30 day (from the date of receipt) with a 15% restocking fee. Any returned item must be in its COMPLETE ORIGINAL PACKAGING for a refund. Return shipping is the responsibility of the buyer.

- 1) What is the range of the various Pranan devices?

All devices create a multi-directional spherical radii protection at these ranges:

BioSpace: up to 43 ft.

Phiwaves: up to 8.5 ft.

Phone: up to 4.6 ft.

Pendant: up to 6.6 ft.

Jewel: up to 6.6 ft.

Travel: up to 23 ft.

- 2) How do the Pranan Devices work?

Pranan device is basically a passive converter of the wide range waves in the fine physical fields. In other words, it converts the length and frequency of electromagnetic waves harmful to the human body in waves with frequency and natural length that the human body can assimilate. That is, Pranan Technology does not store, nor does it filter radiations; but transforms their frequency, wavelength and intensity into some other ones the human being can assimilate better. Pranan Technology is based primarily on developing methods and systems to identify and decode electromagnetic frequencies harmful to human body health, transforming them into some other harmless and assimilable that enhance, at the same time, the bioenergetic activity in the nucleus of body cells. Experience shows that the best place to carry the personal devices are close to body; but they are also effective in a space range of about 2 meters from its location. It is advisable to place it under the pillow when sleeping. This way its effectiveness is higher against

electromagnetic pollution (wi-fi, wireless networks, etc.) present inside the room we are sleeping.

- 3) I cannot find the Phiwaves "graphene" on your website, is the graphene the same as the nano-diamond?

Yes, these terms are interchangeable when spoken of. The older versions of these devices used only graphene as their harmonizing element. Pranan has since added nano-diamonds to the nano-layers of the device for further protection. Therefore, for our devices to fulfill this function of emitting balanced frequencies clearly, various factors come into play. One of them is the composition and atomic structure of the materials Pranan uses. In this regard, one of the materials Pranan uses is carbon-based (graphene). The nano-diamonds contribute to making the "signal" emitted by our devices clearer and extending its reach. Hence, we have improved both protection performance and coverage.

- 4) Are the devices compatible with each other and other electrical and non-electrical devices?

Yes, they do not interfere with other device operation, and do not cause any interference with any other devices of different nature. They are passive converters with no charge. All of the Pranan devices are compatible with one and the other, as well as ground device technology and all other electronics.

- 5) Are the leather lanyard cords on the wearable devices adjustable?

At the moment, they are not. However, Pranan is working on creating adjustable lanyards.

- 6) Will the Phione protect in the same way the Phiwaves will? Does one need BOTH devices? Or will the Phiwaves also protect you from your personal cellphone?

The Technology of the Phione works like the Phiwaves, except that if one talks very often on the mobile phone a protection reinforcement is necessary. This is because the source of the (EM) radiation from the mobile phones located very close to the brain. If one only uses the mobile phone briefly, then the protection of the Phiwaves, while carried on the body, would be enough. However, if you are one who suffers from great EMR sensitivity or headaches after using the mobile phone, then both devices would be highly recommended.

- 7) What is the longevity of the Pranan devices? Will the protection they provide every "fade" or "wear out" over time, thus requiring replacement?

The duration of the devices is infinite. As long as they are used correctly, and not subjected to extreme temperatures or submerged in liquid for long periods or frequently, they will last a lifetime. They require no re-charging or batteries.

- 8) Can the Phione be transferred to my new mobile phone. Or will I need to purchase a new Phione device for my new phone?

The Phione will not be damaged by moving it to a newly upgraded mobile device. It is flexible and very resistant. It is impossible for it to be damaged when changing it to a new mobile device. We can provide new 3M stickers for this purpose if needed.

- 9) Will the Pranan devices protect against all forms of EMR?

No. Pranan devices act on the organism to balance the imbalance caused by electromagnetic radiation at the biochemical level (free radicals, inflammation, etc.), bioelectric level (alteration of brain frequencies), and energetic level (absorbing our energy), as the radiation frequency and intensity increase, the alteration becomes greater and protection more complicated. Therefore, our devices are effective against *non-ionizing* radiation (infrared rays, microwaves, radiowaves & cell-towers) but do not protect against ionizing radiation (gamma rays, X-rays, etc.). We refer to harmful radiations emitted by mobile cell phones, computers, microwave ovens, radar, satellites, scanners, wireless networks and so on. They are also called low intensity radiations. They are among the low frequencies or radio frequencies and ultraviolet. In our case, we refer mainly to waves with frequencies ranging between 100 kHz and 300 GHz. Its use is also recommended to limit the electromagnetic pollution we receive when traveling on planes and trains.

- 10) What should I do if I feel worse when I start using the device?

Sometimes when people begin using the devices, underlying symptoms due to EMR exposure are revealed. If that happens, simply reduce your time with your device until symptoms subside. Then gradually increase time with your device as tolerated. Also, it is important to stay well-hydrated. Occasionally some users have reported an adaptation period of less than 5 days before reaching deep sleep.

11) Can I use the Travel device for airline travel and can I have the Pranan device(s) on me while going through airport security?

As the Travel device has metal/magnetic parts, it will trigger an alarm when passing a scanner at an airport. It is advised to remove it, pass the scanner and then put it back on your person while you're travelling on the plane. In addition, the Travel device in particular will reduce the effects of jet lag! It is perfectly safe to run Pranan devices through airport security scanners/x-rays while packed in carry-on luggage. All other Pranan devices are safe to go through TSA airport security scanners. Its use is recommended to limit the electromagnetic pollution we receive when traveling on planes and trains.

12) Are the Pranan devices submersible?

The Pranan devices are water resistant. However, it would be wise to avoid long term submersion of any of the devices.

13) I wear a pacemaker, will these devices interfere with this?

Being passive converters with no charge, the PERSONAL devices (Phiwaves, Jewel/Pendants & Phione) have no effect on pacemakers and other devices and valves inserted for various functions in the human body. However, if you wear a Pacemaker or other implanted electrical device, for safety & health purposes, please keep your body at about 10-12 inches from the BioSpace 8V-11 and BioSpace Travel devices, as these two devices contain rare-earth magnets within them.

14) Can pregnant women use Pranan devices?

Of course, and without limitation of use. In addition, they are particularly recommended for the protection of the newborn, who are extremely sensitive to radiations.

15) Are there any contraindications?

None, as demonstrated in biochemical studies at the University of Granada, Pranan devices are an excellent means against the underlying state of oxidative stress and inflammation, correcting it to a better state of physiological control of the subject, resulting in his good health condition.
